

Introduction to the Arduino

Instructor: Morgan Redfield
2010 May 16
2-4 PM

Today we'll be covering:

- Microcontroller Overview
- Geography of your Arduino
- What makes an arduino an arduino?
- What can it do?
- How do I use it?
- How do I write code for it?

But first ...

Drivers and IDE

What is a microcontroller?

- Miniature computer
 - Processor
 - Short term memory
 - Long term memory
- Input and Output
 - Digital
 - Analog

Microcontroller uses

- Art projects
- Robots
- Automation
- Human interface devices
- Prototyping
- Sensing
- and more!

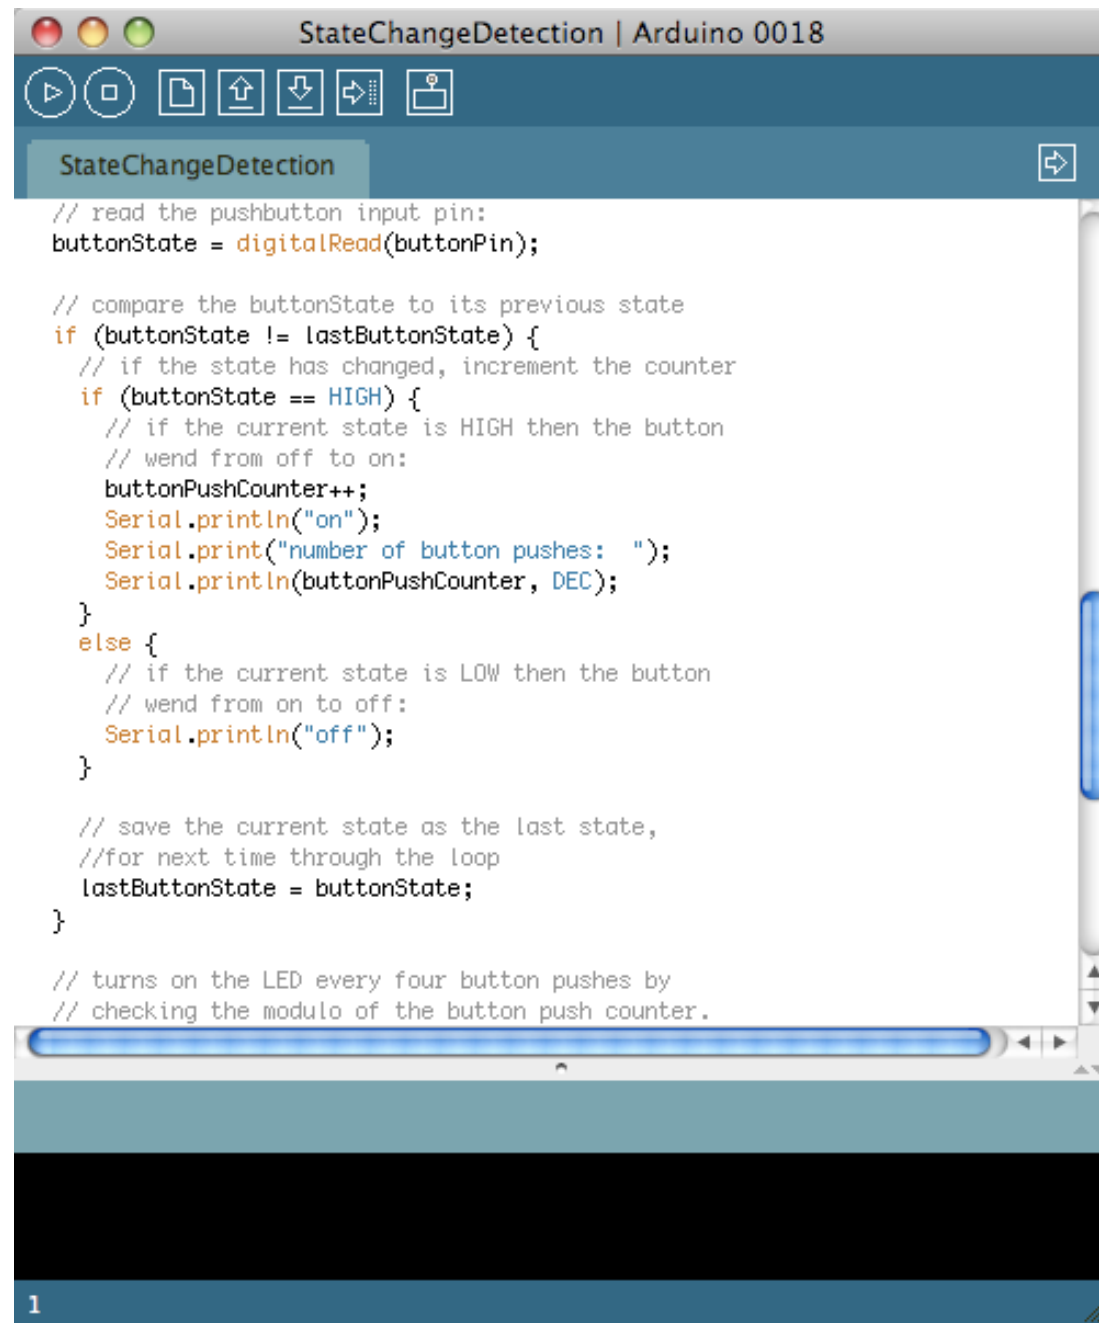

Arduino: microcontroller and more

Your Arduino

- Runs at 16 MHz
- 32 KB Flash memory
- 2 KB RAM
- 3 counters
- 14 digital I/O pins
- 6 10-bit Analog input pins

A brand new IDE

```
StateChangeDetection | Arduino 0018
StateChangeDetection
// read the pushbutton input pin:
buttonState = digitalRead(buttonPin);

// compare the buttonState to its previous state
if (buttonState != lastButtonState) {
  // if the state has changed, increment the counter
  if (buttonState == HIGH) {
    // if the current state is HIGH then the button
    // went from off to on:
    buttonPushCounter++;
    Serial.println("on");
    Serial.print("number of button pushes: ");
    Serial.println(buttonPushCounter, DEC);
  }
  else {
    // if the current state is LOW then the button
    // went from on to off:
    Serial.println("off");
  }

  // save the current state as the last state,
  //for next time through the loop
  lastButtonState = buttonState;
}

// turns on the LED every four button pushes by
// checking the modulo of the button push counter.
```

1

Talking to the Arduino

```
void setup() {  
  Serial.begin(9600);  
}  
  
void loop() {  
  Serial.println("success!");  
}
```

Digital Output

Digital Output

```
void setup() {  
  pinMode(3, OUTPUT);  
}
```

```
void loop() {  
  digitalWrite(3, HIGH);  
  delay(500);  
  digitalWrite(3, LOW);  
  delay(500);  
}
```

Digital Input

Digital Input

```
void setup() {  
  pinMode(3, OUTPUT);  
  pinMode(2, INPUT);  
}  
  
void loop() {  
  if (digitalRead(2) == HIGH)  
  {  
    digitalWrite(3, HIGH);  
  } else  
  {  
    digitalWrite(3, LOW);  
  }  
}
```
